

October 16, 2017

The following guidelines have been developed to determine adequate tug assistance for docking and undocking in the Port of Houston. Similar docks have been grouped and coupled with vessel size and draft information. Assist tugs are then designated by the circumstances of the docking or undocking maneuver. Tugs are categorized by “bollard pull” as provided by area operators. Bollard pull is used rather than horsepower to rate tugs effectiveness. Additionally, the tug’s design type, tractor or conventional has a definite bearing on effectiveness and desirability.

**Tug Class Ratings:
Minimum Bollard Pull (in pounds)**

Class	ahead	astern
S (Small; compact)	35,000	20,000
M (Medium; diamond class)	60,000	45,000
L (Large; twin-screws)	85,000	55,000
T (Tractor)	100,000	90,000
C (Mini ZTECH)	125,000	112,500
Z (Big ZTECH)	160,000	150,000

Big ZTECH can substitute for any class except small

Mini ZTECH can substitute for T, L, M, S

T can substitute for S, M or L

L can substitute for S or M

M can substitute for S except arrivals less than 30'

Bow thruster substitutes for smallest tug

A widebody is defined as any vessel with a beam of 120' or greater.

All vessels requiring tug escort will be of tractor tug design (T, C, or Z).

All vessels with drafts of over 40'-00" will be provided with a Big ZTECH as an extended assist tug from Morgan's Point to destination dock and from departure dock to Morgan's Point.

Thrusters must meet the following minimum requirement of available horsepower to substitute for a tug. (1 KW equals 1.35 HP)

Vessel LOA	Thruster Horsepower
More than 900'	2,500
More than 900' (Bayport and Barbours Cut Only)	2,400
751' – 900'	2,000
551' – 750'	980
501' – 550'	730
451' – 550'	565
350' – 450'	400
Less than 350'	200

October 16, 2017

As always any vessel specific concerns should be discussed with the Houston Pilots because the ultimate decision falls to the pilot. Ships and the waters in which they operate represent a dynamic, ever-changing environment. Firm rules addressing every possible scenario are not possible. The individual pilot on board is best situated to evaluate the specific docking and/or undocking evolution contemplated by the vessel and the prevailing weather, current, and traffic situation affecting the vessel. These guidelines are recommendations only. It is recognized that the on-scene discretion of the pilot and master should not be hindered. The following guidelines regarding tug assistance for docking and undocking are in no way intended to limit, hinder, or override the on-scene discretion of the pilot. We realize that there will be situations where actions that conflict with these recommendations may be necessary to address specific situations or special circumstances that confront a specific vessel. Further, it is recognized that the vessel, tug design, and terminal configuration may change requiring a departure from the current tug assistance for docking and undocking guidelines.
